

Krylov geometry in Model 1 (baseline)

The same population Krylov spaces are expressed in nearly collinear versus orthonormal coordinates.

Pairwise dependence matrix

Raw FPLS Krylov basis

66/66 edges shown

$$\kappa_2(\tilde{H}_{12}) = 1.0 \times 10^{16}$$

Arnoldi FPLS (CGS2)

0/66 edges shown

$$\|Q^T Q - I\|_2 = 8.5 \times 10^{-16}$$

An edge is shown when the absolute normalized inner product is at least 0.20. Population geometry: $J = 100$, $T = 200$, $m = 12$.
